

INDIVIDUAL REFLECTION

Working on the Hotel Accommodation and Reservation Management System gave me practical experience in applying C++ concepts to a real-world problem. My main contribution to the project was developing the guest registration and reservation management modules.

Through the guest registration module, I learned how to collect and organize guest information using classes and objects. I understood the importance of storing the required details correctly because the reservation process depends on accurate guest information. This part of the project helped me understand how data can be managed systematically instead of handling everything through separate variables.

I was also involved in the reservation management process. I worked on the logic required to create reservations by checking the guest information and room availability. The system had to prevent a room that was already occupied from being reserved again. This helped me understand how conditions and validation can be used to prevent incorrect operations in a real application.

Another important learning experience was connecting my module with the other parts of the project. Guest registration, room management and reservation operations were dependent on each other, so the modules had to work together correctly. During integration, I learned that even when an individual section works properly, problems can occur when it is combined with other modules.

Testing the reservation process also helped improve my programming skills. We checked different situations such as registering a guest, reserving an available room, trying to reserve an occupied room and cancelling a reservation. These tests helped us identify logical problems and make the overall system more reliable.

Working as part of a team taught me the importance of communication and coordination in software development. Each member worked on a different part of the application, but all the modules had to be integrated into one complete system. I learned to discuss problems with team members, make necessary changes and test the combined application.

Overall, this project improved my understanding of C++ object-oriented programming and gave me practical experience with classes, objects, data management, conditional logic, validation and testing. More importantly, I learned how an individual module contributes to a complete software system and how teamwork is necessary to successfully develop and integrate a project.
